(54) Color film analysing method and apparatus therefore.

(57) A color film analysing method and apparatus which displays the image data as positive images provided by a TV camera and a plurality of reference images previously provided and stored in a recording member, in a matrix pattern on an image display device (33). When specifying one of the color images of the picture frames, the image line of the matrix including the specified image is shifted adjacent to the reference image line on the image display device and a cursor image is displaced overlapping the specified image. The cursor image is provided as a reversed image of the part of the specified image where the specified image is inlaid with the cursor image. If the reversed image has a color identical or similar to that of part of the specified image surrounding the cursor image, the cursor image is colored differently. Any images, when specified, is magnified and displayed at the center of the image display device (33).
